

Executed cutting-edge technology projects from the design phase through commissioning through evaluating, defining & managing battery storage opportunities while overseeing engineering activities to ensure projects are completed on time.

- Identified gaps in project scope and recommended solutions for successful completion of large-scale utility projects through applying Electrical/Power Systems knowledge and engineering, construction, and permitting concepts.
- Reviewed single line drawings, communication wiring diagrams, and BESS system layouts.
- Effectively communicated with key stakeholders and provided innovative solutions to cross-functional teams while taking complete ownership of the project.
- Established open lines of communication with internal customers (project managers, product engineers, sales team) and external customers (utilities, AHJs, contractors, end customers).
