

Managed software development and maintenance for critical system components while constructing efficient processes operating on large distributed systems using Oracle PL/SQL. Delivered complex mission-critical applications in a large processing environment while effectively managing offshore contractors.

- Designed and developed complex applications and programs by collaborating with project teams in gathering requirements.
- Translated business requirements and functional design specifications into technical solutions.
- Collaborated with multi-functional engineering teams to define and implement some of the core backend platform frameworks and systems
- Worked closely with the development team to ensure proper system design and implementation.
- Assessed design and development need to evaluate the proposed changes to build or enhance the software solution.
- Provided ongoing support to users through maintenance and troubleshooting.
- Ensured that security and quality assurance best practices are followed throughout the software development lifecycle.
